Senior Backend Engineer — Fullstack Specialist

Email : jvegar@uni.pe

Mobile : +51-991139451

Lima, Perú

Senior Backend Engineer specializing in **Distributed Systems** and **Event-Driven Architecture**. Expertise in migrating legacy monoliths to **Microservices** using **CQRS** and **Event Sourcing**. Proven track record of designing high-scale systems with **NestJS**, **Kafka**, and **PostgreSQL**.

EXPERIENCE

• BairesDev

Software Engineer

Remote

Sept 2021 – Present

◦ Fintech Project: Lucinity

- * Architected and developed scalable GraphQL services using TypeScript, Express, and Apollo Server, facilitating the migration of legacy Python (FastAPI) REST endpoints.
- * Implemented Event Sourcing patterns utilizing a custom internal library leveraging PostgreSQL NOTIFY for event stores and real-time projections.
- * Developed reusable UI components with React, Material UI, and Storybook, ensuring design consistency and internationalization (i18next).
- * Managed database schema evolution by writing and executing complex Flyway migrations for PostgreSQL.

◦ EdTech Project: Instructure

- * Led the backend migration of a legacy WebPD application from Node.js v5/Hapi to a modern, containerized AWS Fargate environment.
- * Refactored legacy JavaScript to modern ES6+ standards (Async/Await, Promises), improving maintainability and performance.
- * Modernized DevOps workflows with optimized Docker configurations, integrating AWS S3, Redis, ElasticSearch, and MariaDB.
- * Increased reliability by identifying deprecated libraries and expanding the test suite for the migrated architecture.

◦ Logistics Project: Haul

- * Executed a monolith-to-microservices migration, decoupling logic into dedicated Command and Query services using NestJS.
- * Implemented CQRS and Event Sourcing using a custom NestJS library with MongoDB as the primary event store.
- * Integrated Kafka to manage asynchronous communication and event-driven workflows between microservices.
- * Developed fullstack features for the Admin module using React, Redux, and React Query for efficient data caching.

• NTT Data

Centers Lead Developer

Lima, Perú

Sept 2020 – Aug 2021

◦ Project Acciona: Energy & Infrastructure

- * Architected a custom stock-share registration portal for employees using SPFx, React, and Power Platform.
- * Developed serverless integrations with Azure Functions (Node.js) for third-party SMS API orchestration and user verification.
- * Engineered high-complexity forms supporting multi-language translation and robust validation via React and Power Automate.
- * Mentored a junior development team, providing code reviews and guidance on modernizing SharePoint practices.

◦ Project Red Eléctrica de España: Energy

- * Developed mission-critical server-side components (Event Receivers, Timer Jobs, Web Parts) and PowerShell automation scripts.
- * Designed the migration strategy for transitioning legacy on-premise components to SharePoint Online with minimal downtime.
- * Customized UI/UX environments through the development of custom Master Pages and advanced branding layouts.

SIDE PROJECTS

- **Blasón**

Lima, Perú

Founder & Lead Engineer — Legaltech SaaS for Peruvian Notaries

Jun 2026 – Present

- Designed and built a full-stack legaltech SaaS from scratch that automates public deed generation for Peruvian notaries, reducing registry observations and operational overhead.
- Architected a NestJS modular monolith with DDD and Hexagonal Architecture, split into six bounded contexts (Identity/RBAC, Document Intake, Notarial File, Document Management, Legal Directory, Legal Acts) communicating exclusively through domain events.
- Engineered a document processing pipeline on BullMQ and Redis: AWS Textract OCR for scanned documents, OpenAI LLM extraction driven by database-backed prompt and schema templates, and PDF post-processing that overlays invisible searchable text on scanned PDFs.
- Built a data-driven document classification engine (keyword banks and geometric signatures) and a rules engine that evaluates legal requirements per notarial act to compute required-document checklists.
- Implemented the notarial workflow as an aggregate-root state machine (kardex numbering, validation, process states) with append-only audit trails, plus real-time updates over Socket.IO.
- Developed a React 18 + Vite + Tailwind frontend featuring an interactive PDF viewer that highlights LLM-extracted fields via text-layer evidence matching, with JWT + Argon2 role-based access control (admin, notario, oficial_mayor) and PostgreSQL via Prisma.

EDUCATION

- **University of the Pacific**

Lima, Perú

Master in Finance – Investment Portfolio Management

- **National University of Engineering**

Lima, Perú

Bachelor in Systems Engineering

TECHNICAL SKILLS

- **Architecture & Backend:** Distributed Systems, Microservices, CQRS, Event Sourcing, DDD, NestJS, Node.js, GraphQL (Apollo), Python, C#
Data & Messaging: Kafka, PostgreSQL (Flyway), MongoDB, Redis, Elasticsearch, MariaDB
Cloud & Infrastructure: AWS (Fargate, S3, ECS), Azure (Functions, Web Apps), Docker, Kubernetes, Terraform, GitHub Actions
Engineering Productivity: Arch Linux, NeoVim (Custom LSP/Treesitter), Tmux, Git, Shell Scripting (Zsh/Bash)
Languages: Spanish (Native), English (C1 Advanced)
